PROBLEM STATEMENT 05

Build a Pre-Meeting Briefing Agent

Preparing for important meetings often requires researching companies, individuals, recent announcements, leadership changes, and other developments. This information is scattered across multiple sources, making manual research time-consuming, and AI-generated summaries can miss important updates or present unsupported information as fact.

The challenge is to build an agent that gathers recent, relevant information and turns it into a concise, source-backed briefing.

GOAL

Build an AI-powered research agent that takes a company or person and a meeting time as input, then produces a one-page briefing covering relevant developments from the previous 30 days.

CORE REQUIREMENTS

- **Meeting context:** Accept a company or person and the scheduled meeting time.
- **Recent research:** Identify relevant developments from the preceding 30 days, including news, launches, hires, and other meaningful updates.
- **Concise briefing:** Produce a structured, one-page report that helps the user prepare for the meeting.
- **Source attribution:** Include sources for factual claims so the user can verify the information.
- **Open questions:** Highlight relevant questions or discussion points that may be useful during the meeting.

EXPECTED OUTCOME

A working meeting-preparation agent that transforms recent web research into a concise, reliable, source-backed briefing that helps users enter conversations better informed.

OPTIONAL IMPLEMENTATION GUIDANCE

Participants may explore briefings for sales calls, partnership discussions, investor meetings, or business development conversations. Tavily can provide web search and research capabilities, while Bifrost can manage model requests and related gateway functionality. The agent should distinguish verified findings from uncertain information and avoid inventing unsupported details.
